## ABSTRACT

Love is an issue raised with some frequency by counseling clients. Research investigating the nature of love may be useful in providing a framework that counselors can use to conceptualize the signs and symptoms of clients who present with relationship issues when seeking help. This study was conducted to examine the nature of love as measured by three instruments, one deductively grounded instrument by Hendrick and Hendrick and two inductively grounded instruments, the Love Relationships Scale and the Triangular Love Scale. Findings from 69 students revealed the dominant operation of obsessive thought as an important aspect of love as reflected in the isolation of factors named Obsessive Thought, Idealization, and Mania. Findings suggest that a "Thomsonian" or "G"-factor conceptual framework, in which one dimension (apparently involving obsessive thought) dominates meaning, appears to be necessary as a model of romantic love. Other dimensions appeared to delineate nuances about this dominant dimension. (NB)

28, 1992.

### **ABSTRACT**

Love is an issue raised with some frequency by counseling clients. The present study investigated the nature of love measured by three instruments. Of course, no one study is sufficient to define abstract constructs. But studies that investigate the nature of love are useful in providing a framework that counselors can use to conceptualize the signs and symptoms of clients who present relationship issues when seeking help. The results in the present study suggest that a "Thomsonian" or "G"-factor conceptual framework appears to be necessary as a model of romantic love.

Behavioral scientists have traditionally eschewed scholarly inquiry regarding love phenomena. As Wrightsman and Deaux (1981, p. 170) observed, researchers have historically "believed that love is too mysterious and too intangible for scientific study." Initial investigations of love phenomena conducted during the 1940s were "followed by nearly a 20-year period in which there is almost no published evidence of efforts to investigate love phenomena using inventories or paper-and-pencil testing" (Elkins & Smith, 1979, p. 10). For example, Curtin (1973) found that love was not mentioned in the 23 volumes of the Annual Review of Psychology that he surveyed. However, as C. Hendrick and S. Hendrick (1986, p. 392) noted, "During the past decade, love has become respectable as an area for study by psychologists." Work by Rubin (1984), by Sternberg and Grajek (1984), and by Tennov (1979) illustrates efforts to develop science in the area of love phenomena.

One important series of studies has been deductively grounded (Borrello & Thompson, 1990a, 1990b; C. Hendrick & S. Hendrick, 1986, in press; C. Hendrick, S. Hendrick, Foote & Slapion-Foote, 1984; S. Hendrick & C. Hendrick, 1987; Thompson & Borrello, 1992) in Lee's (1973/1976) typology of love, i.e., specific measurement items have been derived from a general theory. This particular general theory posits three primary love styles: (a) *eros*, which is romantic or passionate love, (b) *ludus*, which is game playing love, and (c) *storge*, which is friendship love. Lee suggested that three secondary styles are formed as compounds of the primary styles, but still have their own unique properties and characters: (d) *mania*,

which is a compound of ludus and eros, (e) pragma, which is a compound of storge and ludus, and (f) agape, which is a compound of eros and storge. In at least three major studies with discrete and large cohorts of subjects Hendrick and Hendrick have consistently found that their measure yields a six-dimensional orthogonal structure corresponding to the elements of Lee's (1973/1976) typology.

Two other series of studies of love has been primarily inductive (Thompson & Borrello, 1990), i.e., measurement items have been elaborated based on integrating specific insights and then attempting to delineate theory. One series of studies in this genre has utilized the Love Relationships Scale (Borrello & Thompson, 1987, 1989a, 1989b; Thompson & Borrello, 1987a, 1987b). A second series of studies has employed the Triangular Love Scale (Sternberg, 1988, pp. 99-100; Sternberg & Grajek, 1984).

The present study was conducted to explore relationships among scores on these three measures. Specifically, two questions were addressed? First, what dimensions underlie the response patterns on the three measures? Second, in what ways are factor scores on the measures related with each other?

### Method

#### Subjects

Subjects in the study were 69 students enrolled in various classes. The mean age was 22.80 ( $SD=7.57$ ). There were more females (62.3%) than males in the study. Most of the subjects were nonminority students (84.1%), though 4 subjects were African-

American (5.8%), 4 were hispanic (5.8%), and 3 were members of other minority groups (4.3%).

### Results

Factor analytic studies of measurement integrity are important, as Nunnally (1978, pp. 111-112) notes:

construct validity has been spoken of as "trait validity" and "factorial validity".... Factor analysis is intimately involved with questions of validity... Factor analysis is at the heart of the measurement of psychological constructs.

Gorsuch (1983, pp. 350-351, emphasis added) has concurred in noting that "a prime use of factor analysis has been in the development of both the theoretical constructs for an area and the operational representatives for the theoretical constructs." Similarly, C. Hendrick and S. Hendrick (1986, p. 393) stated that "theory building and construct measurement are joint bootstrap operations." Factor analysis at once both tests measurement integrity and sheds light on underlying theory.

Factor analysis was employed to address the study's first research question. Figure 1 presents the "scree" plot of the eigenvalues associated with data from the Thompson-Borrello Love Relationships Scale prior to rotation (Thompson, 1989). Table 1 presents the related five principal components after rotation to the varimax criterion.

---

INSERT FIGURE 1 AND TABLE 1 ABOUT HERE.

---

Figure 2 presents the "scree" plot of the eigenvalues associated with data from Sternberg's Triangular Love Scale prior to rotation. Table 2 presents the related five principal components after rotation to the varimax criterion.

---

INSERT FIGURE 2 AND TABLE 2 ABOUT HERE.

---

Figure 3 presents the "scree" plot of the eigenvalues associated with data from the Hendrick-Hendrick measure prior to rotation. Table 3 presents the principal components after rotation to the varimax criterion.

---

INSERT FIGURE 3 AND TABLE 3 ABOUT HERE.

---

Least-squares factor scores were then computed on each factor for each subject. To address the study's second research question, canonical function analyses of the relationships among the factor scores were then conducted (Thompson, 1991). These analyses are reported in Table 4.

---

INSERT TABLE 4 ABOUT HERE.

---

### Discussion

Some generalizations can be formulated from results in the present study, notwithstanding the inherent limits of sample size and type, because the results continue to replicate findings reported in various previous studies (e.g., Borrello & Thompson, 1987, 1989a, 1989b). Once again the dominant operation of obsessive thought as an important aspect of love is reflected in the

isolation of factors named "Obsessive Thought", "Idealization", and "Mania", in separate factor analyses reported in Tables 1 through 3, respectively. The related nature of these constructs is evidenced in canonical functions I ( $R^2=37\%$ ), I ( $R^2=66\%$ ), and II ( $R^2=50\%$ ), reported in Table 4; these constructs tended to load together on one function across the three sets of analyses reported in Table 4.

The results reinforce previous findings suggesting that love is a "G"-factor phenomenon (e.g., Sternberg & Grajek, 1984) in which one dimension (apparently involving obsessive thought) dominates meaning. However, other dimensions delineate nuances about this dominant dimension.

Of course, no one study is sufficient to define abstract constructs. But studies that investigate the nature of love are useful in providing a framework that counselors can use to conceptualize the signs and symptoms of clients who present relationship issues when seeking help. As Sternberg and Grajek (1984) have suggested, a "Thomsonian" or "G"-factor conceptual framework appears to be necessary as a model of romantic love.
